

Intelligent Approval Automation System

Week 8 | From date 4/10 - 4/17

Leader:

Shayan Asif Time Spent 9.5 hours	Tasks Completed: • Designed and refined the landing page using React and Tailwind, improving layout, visual hierarchy, and overall user flow while establishing a consistent design direction • Implemented authentication flow using Supabase Auth, including login, session management, and groundwork for OAuth integration • Integrated frontend with backend (FastAPI), ensuring protected routes and secure API access based on user authentication state • Structured the app with clear separation between public (landing) and protected (dashboard) views, setting up a scalable foundation for future features • Fixed search feature in dashboard Planned Tasks for Next Week: • Set up CI/CD pipeline for automated builds and deployment • Integrate frontend with backend services and APIs
Hamere Abate Time Spent 7 hours	Tasks completed: • Continued to work on Scalability Plan outlining how the system can support up to 100,000 concurrent users by distributing workload across frontend, backend, database, workflow automation (n8n), and AI services. • https://docs.google.com/document/d/11pb4Xr-jDB73ogXLMUDC-a14bKq9vb239SH-k8mQbHl/edit?usp=sharing • Continued to work on the Risk Management Plan identifying key technical, performance, security, and workflow risks, along with mitigation strategies to ensure system reliability and scalability. • https://docs.google.com/document/d/1wcln3GEIODMkzZgszZTIO_k8kERK1DFmXj4jTLs_CDc/edit?tab=t.0 • Collaborated with team members to develop and refine the project documents • Assisted in defining and documenting Phase 3 (AI integration), including AI analysis features and system workflow integration. Planned tasks for next week: • • Any issues or challenges: • Finalizing scalable design decisions while balancing simplicity and

	implementation feasibility.
Luis Jaimes 8 hrs	Tasks completed: • No longer need Zapier. Created an email reader in my n8n workflow • Working on assets, rooms, and a simple nodes reader in n8n. Have the room booking check complete, but still working on the asset and nodes in which no AI is needed to calculate if major risk. • Looking into ways for admins to easily add new assets that are available to use or not. • Created n8n to work fully online, and no longer does it require for my laptop to be on and running. Meaning the website is fully up and running without the use of hardware. • Tested multiple different scenarios, but cleaned up the database afterward to avoid confusion • Created asset tables in Supabase to try and test the n8n workflow. • Attempting to make n8n figure out what the user is trying to request. If no room is being requested, then don't bother reading the database of rooms to save response time. If only requesting something small, then no need to read in all database of rooms or assets. Planned tasks for next week: • Find a way to make n8n consider assets, room booking, and several other situations. Looking to find a way to make it so if the request is little, then no use of AI should be used to save costs. Any issues or challenges: Multiple attempts to create a complex n8n with over 25 nodes to work together created several bugs and didn't run several times. Had to revert back to what I had before, but this time fully on the cloud. Having a hard time solving the issue of detecting what is being detected
Carlos Ortiz III Time Spent 9 hours	Tasks completed: • Updated Jira to match current progress • Created a bug report document detailing current issues with the website ◦ Detailed issues, marked as either major or minor ◦ Tested on user account and the main admin account ◦ Also lists current missing functionalities ◦ Link:  Bug Report.pdf • Communicated with group on current progress of project Planned tasks for next week: • Update Jira for next week • Further examine bugs, find potential causes, or otherwise document issues with page • Help with deployment & any other coding as needed Any issues or challenges:

	•
Adith Ganagalakunta Time Spent 12 hours	Tasks completed: • Added stronger Supabase row-level security policies for profiles, emails, email_summaries, requests, and activity_log • Added helper SQL functions for admin-role checks and current-user email scoping so data access is enforced in the database, not just in the frontend • Tightened profile update rules so users can manage their own profile data without freely changing role access after account creation • Refactored the frontend Supabase data layer to use paginated, filtered queries instead of broad whole-table fetches • Reworked dashboard stats to use scoped count queries rather than computing everything in the browser • Added shared loading, empty, error, and retry UI states so failures and no-data cases are explicit across the app • Updated the dashboard, approval queue, my requests, activity log, request detail, and analytics pages to use the new query patterns and state handling • Moved admin-only views like Activity Log and Analytics behind admin-only routing and sidebar access • Added frontend test infrastructure with Vitest and Testing Library • Added passing tests for route guards, Supabase request actions, and the submit-request flow Planned tasks for next week: • Apply the new RLS migration to the live Supabase project and validate that requester/admin access behaves correctly in production • Test the full app end to end against live Supabase data, especially request visibility, admin actions, and activity-log access • Upgrade local/dev runtime to Node 20+ everywhere so development matches the app's expected environment • Add server-side or RPC-backed analytics views for trends over time instead of only current snapshot metrics • Add more frontend test coverage for dashboard data states, approval

	queue filters, and request detail actions • Clean up merged repo artifacts like tracked __pycache__ files and any leftover duplicate landing-page structure that is no longer part of the main app • Verify the updated frontend still works cleanly with the existing email-processing backend and approval pipeline
--	--

Total Time Spent: 40.5

Summary: Designed new dashboards and landing page
